

MD recovers the FDA-approved allosteric site in CCR5

C

Key findings – CCR5 (Gi, PDB 7F1Q)

- 13 persistent pockets detected across 600 frames (3 × 200 ns)
- Orthosteric pocket recovered (mean freq = 0.947, 70 lining residues)
- Allosteric Na⁺ pocket at 2.50 · 3.39 · 7.49 (mean freq = 0.91)
 - co-localises with maraviroc binding site (FDA-approved inhibitor)
- 5 / 13 pockets at the G-protein coupling interface
 - potential sites for pathway-selective modulation
